

Astrology Chart Calculator

Computes birth charts with full support for lesser-used points that most astrology tools skip — Part of Fortune, Part of Spirit, the Lunar Nodes, Vertex, and Chiron — alongside standard planets, aspects (including detected patterns like Grand Trines, T-Squares, and Yods), essential dignity, and house interpretation that actually explains empty houses through their ruling planet rather than ignoring them.

Includes a Streamlit web interface for interactive local testing, and generates a ready-to-use LLM prompt for full chart interpretation.

Setup

1. Install Python 3.10+ if you don't already have it.

2. Clone this repo and install dependencies:

```
git clone <your-repo-url>
cd astro-app
pip install -r requirements.txt
```

(Consider using a virtual environment: `python3 -m venv venv && source venv/bin/activate` before the pip install.)

3. Download the Chiron ephemeris file (one-time):

```
python3 download_ephemeris.py
```

This downloads `seas_18.se1` into a local `./ephe` folder. The standard planets work without this (pyswisseph has a built-in approximation), but Chiron specifically needs it.

4. Run the app:

```
streamlit run app.py
```

This opens a browser tab at `http://localhost:8501` with the interactive interface.

Project structure

File	Purpose
<code>app.py</code>	Streamlit frontend — the entry point
<code>chart_points.py</code>	Core ephemeris calculations (planets, angles, houses, Nodes, Part of Fortune/Spirit, Vertex, Chiron)
<code>aspect_engine.py</code>	Aspect detection + pattern recognition (Grand Trines, T-Squares, Grand Crosses, Yods, Stelliums)
<code>dignity.py</code>	Essential dignity (Rulership, Exaltation, Detriment, Fall)
<code>house_interpretation.py</code>	House themes + empty-house interpretation via ruling planet
<code>prompt_builder.py</code>	Assembles all computed data into an LLM-ready interpretation prompt
<code>birth_input.py</code>	Geocodes a location string and resolves the correct historical timezone automatically
<code>download_ephemeris.py</code>	One-time setup script for the Chiron data file

Deploying publicly (later)

This same codebase deploys to [Streamlit Community Cloud](https://streamlit.io/cloud) for free, with no code changes:

1. Push this repo to GitHub (public repo required for the free tier)
2. Go to share.streamlit.io, connect your GitHub account, point it at this repo and `app.py`
3. Add a `packages.txt` file if the deploy environment needs system-level build tools for `pyswisseph` (check Streamlit Cloud's build logs if the deploy fails on the `pyswisseph` install step)
4. The `./ephe` folder needs to be committed to the repo (or downloaded via a startup script) since Streamlit Cloud won't have run `download_ephemeris.py` for you

License

Add an open-source license of your choice (MIT is a common default for this kind of project) before making the repo public.
